

Fizz Buzz in Python

2009

1 min read • 61 words

Jeff Atwood of [Coding Horror](#) has developed a sure fire test to filter out good programmers from bad ones. It's called [the FizzBuzz test](#), and it's a very simple problem to solve.

```
for i in range(1, 101):
    if not i % 15:
        print "FizzBuzz"
    elif not i % 3:
        print "Fizz"
    elif not i % 5:
        print "Buzz"
    else:
        print i
```
