Dev Tool: Ghost - Manage / etc/hosts

2010

1 min read • 129 words

The Ruby community has really been blowing me away lately with their array of indispensable web development tools.

Ghost is no exception to this rule. It is a simple command line application for adding and removing 127.0.0.1 entries in your `/etc/hosts` file. I can't believe I hadn't thought of this sooner

> This "why didn't I think of that?" moment captures the essence of good tooling - solving obvious pain points that developers endure daily.

.

Example Usage

```
$ ghost add mydevsite.local
[Adding] mydevsite.local -> 127.0.0.1

$ ghost add staging-server.local 67.207.136.164
[Adding] staging-server.local -> 67.207.136.164

$ ghost list
Listing 2 host(s):
mydevsite.local -> 127.0.0.1
staging-server.local -> 67.207.136.164

$ ghost delete mydevsite.local
[Deleting] mydevsite.local
```

Installation

```
sudo gem install ghost
```

Yes, it's really that easy. Make sure to checkout the GitHub Repo to contribute!
